Color Background Flash Wizard® version history

© 2006 - 2009 Roger Reed dba Reed Enterprises, all rights reserved.

Version: 2.0 – Mar 2009 – Added pulldown listbox for the power range of the flashes. Added input field for the Minimum allowed flash distance. This prevents the calculation indicating a flash power setting that isn't even available for your flash. Added a pulldown listbox for indicating how many ND filters are mounted on your flashes. This is handy when your flash GN is too large for your studio even with the maximum power reduction available (allows the possibility of three more steps of power reduction).

Version: 1.1 – July 2006 – Originally flash distances were based on a user input power. When the calculated distance was too large the user would reduce the power and recalculate. This was repeated until the distance became a useable distance. The new method allows the user to input the maximum distance allowed for his particular studio size. This is done only once. After that flash power is calculated automatically along with the distances that fit within the predetermined dimensions.

Version: 1.0 - May 2006 - Initial Release.
