Sun/Fill & Light Fall-off Flash Wizard® version history.

© 2007 – 2009 Roger Reed dba Reed Enterprises, all rights reserved.

Version: 2.0 – March 2009 – A field for minimum flash distance was added so that the user is notified when the flash GN is too small rather than being presented with a flash distance that is too small to be useable. Fields were added to allow the use of ND filters on a flash that has a GN that is too large. Fields were added to allow the input of the power range capability of the flash. This prevents the calculation from displaying a power setting that is beyond the capability of your flash. Where ever practical, pulldown lists are used instead of requiring hand writing the value into the field. This reduces input errors (it is common for the stylus to accidentally ever so lightly touch the writing surface and a tiny decimal point gets entered with your other numbers – causing an error).

Version: 1.0 - August 2007 - Initial Release of Sun/Fill Flash Wizard® and Light Fall-off Flash Wizard® .
